Not illustrated. 1858 Excerpt: . . . a much more common plant, or to some species of ErylbrocZonizzm. All these Algae have a similar external habit, though ditfering widely in structure and fructification. Fig. 1. CnYLoCLADIA CLirroru, -the natural size. 2. Apex of a branch, with young ramuli. 3. Portion of the periphery: -the latter figures more or less magaFed. GEN. CHAn. ! cylindrical, branched, consisting of a tubular or solid axis formed of interwoven laments, clothed externally with radiating, free, branched peripherie laments. owes obovate, borne on the radiating filaments. -MYluocLADIA (J. .), from v, ousand, and xkao, a branch. MralocLAnIA Sciurus; frond solid, snbsimple or alternately branched; branches worm-like, attenuate at base, very long, simple; peripherie filaments elongate, branched at base, nearly cylindrical; articulations shorter than their breadth, slightly contracted at the joints. DEsCn. Root a conical disc. Froud 1-2 feet long, two lines in diameter, at first simple, afterwards emitting alternate or irregularly scattered branches, similar to the primary frond, and always quite simple. The branches frequently issue only near the base of the main trunk, and are 12-14 inches long, and generally bare of ramuli; but in old specimens a few ramuli are sometimes given olf. Every portion of the frond is thickly clothed with long, free, villous, hair-like jilaments; these are branched at base, the branches simple and thread-like, coloured, and articulated; the articulation somewhat contracted at the septa, and shorter than their diameter. No fruit has been seen. The substance of the axis is firmly gelatinous...
